Richmond, Virginia

Meditech has just set up its new vascular probe line for mass production after landing a major contract.

Marissa is the new ops manager and can't figure out why production isn't going smoothly.

Two weeks later…

I don't understand it. It's 75% the same process as the other production line. What's wrong?

What seems to be the problem, Marissa?

So while it seems like Jorge is slow, he's actually a bit overloaded.

Let me reallocate more tasks further upstream and see if that makes the line more balanced.

AHA! It looks like station 3 has a lot more of the workload than stations 5 and 6, which are both showing more unit-out-of-view time.

The answer is sometimes buried in the details. Let's take a closer look.

With the help of Drishti's line balancing report, Alexis can identify the problem fast.

Marissa makes the call.

I don't understand it. Now I've got 5 people on the line, and it's still going at the same speed.

Our throughput is really low on our new line even though the process should be nearly identical to our other products.

Things are flowing much smoother now. I used Drishti to balance the other lines, and every line is increasing throughput by at least 4%! We're running ahead of schedule!

Two weeks later…

I don't understand. It's this new process. Why is this happening? What's wrong?

What's wrong?
